

from [said] a center plane of said female profile which is greater than a maximum lateral offset from said center plane of said first wall.

4. (Amended) The zipper as recited in claim [1] 2, wherein said first wing has an apex having a lateral offset from [said] a center plane of said female profile which is greater than a lateral offset from said center plane of a junction of a rear surface of said first wing and a side surface of said first wall.

8. (Amended) A plastic zipper comprising first and second fastener strips, wherein said first fastener strip comprises a first base and a male member projecting from said first base and having a profile with an expanded head, and said second fastener strip comprises a second base and a female [member] structure projecting from said second base and having a profile with a groove for receiving said expanded head of said male member, and wherein said female [member] structure comprises first and second generally T-shaped sides defining an opening, wherein each of said first and second generally T-shaped [surfaces] sides has a guide surface for guiding said male member toward said opening when said male member impinges on said guide surface, said guide surface having an apex which is laterally offset from a center plane of said female [member] structure by an amount which is greater than the lateral offset of an outer junction, said outer junction being located where an undersurface of a transverse portion meets a side surface of a stem portion of a T-shaped side, and each of said guide surfaces having a distance from said second base that increases with increasing distance from said center plane of said female structure.

9. (Amended) The zipper as recited in claim 8, wherein said transverse and stem portions of each of said first and second generally T-shaped sides of said female [member] structure are integrally formed.

11. (Amended) A package comprising a receptacle having a mouth at an upper end, a plastic zipper attached to said mouth and comprising first and second fastener strips, wherein said first fastener strip comprises a male member having a profile with an expanded head and said second fastener strip comprises a female [member] structure having a profile with a groove for receiving said expanded head of said male member, and wherein said female [member] structure comprises a base, first and second walls extending from said base, first and second hooks extending from said first and second walls respectively toward a center plane of said female structure, and first and second wings extending from said first and second walls respectively away from said center plane, said first and second wings being sloped so as to guide said male member towards said center plane of said female structure when said male member impinges on either of said first and second wings during movement toward said female structure.

16. (Amended) The package as recited in claim 11, wherein said first hook has a [first] surface facing said first fastener strip and said guide surface of said first wing [has a second surface facing] faces said first fastener strip, said [first and second surfaces] surface of said first hook and said guide surface of said first wing being neither parallel nor perpendicular to a plane of said base.

17. (Amended) The package as recited in claim 16, wherein said [second] guide surface of said first wing is closer to parallel with said base plane than is said [first] surface of said first hook.

18. (Amended) A package comprising a receptacle having a mouth at an upper end, a plastic zipper attached to said mouth and comprising first and second fastener strips, wherein said first fastener strip comprises a first base and a male member projecting from said first base and having a

profile with an expanded head and said second fastener strip comprises a second base and a female [member] structure projecting from said second base and having a profile with a groove for receiving said expanded head of said male member, and wherein said female [member] structure comprises first and second generally T-shaped sides defining an opening, wherein each of said first and second generally T-shaped [surfaces] sides has a guide surface for guiding said male member toward said opening when said male member impinges on said guide surface, said guide surface having an apex which is laterally offset from a center plane of said female [member] structure by an amount which is greater than the lateral offset of an outer junction, said outer junction being located where an undersurface of a transverse portion meets a side surface of a stem portion of a T-shaped side, and each of said guide surfaces having a distance from said second base that increases with increasing distance from said center plane of said female structure.

19. (Amended) The package as recited in claim 18, wherein said transverse and stem portions of each of said first and second generally T-shaped sides of said female [member] structure are integrally formed.

21. (Amended) A plastic zipper comprising first and second fastener strips, wherein said first fastener strip comprises a male member having a profile with an expanded head and said second fastener strip comprises a female [member] structure having a profile with a groove for receiving said expanded head of said male member, and wherein said female [member] structure comprises first and second hooks extending toward a center plane and defining an opening which communicates with said groove, and first and second wings extending away from said center plane, said first hook and said first wing being integrally formed and supported in a region intermediate the respective ends of said first hook and said first wing, and said second hook and said second wing

being integrally formed and supported in a region intermediate the respective ends of said second hook and said second wing, said first and second wings having respective surfaces for guiding an impinging male member toward said opening during movement of said male member toward said female structure.

22. (Amended) A plastic zipper comprising first and second fastener strips, wherein said first fastener strip comprises a male member having a profile with a base and an expanded head and said second fastener strip comprises a female [member] structure having a profile with a groove for receiving said expanded head of said male member, and wherein said female [member] structure comprises a base, first and second walls extending from said base, first and second hooks extending from said first and second walls respectively toward a center plane, and first and second target apices located away from said center plane, the distance between said first and second target apices defining a target width, wherein said zipper has a ratio of target width to zipper height substantially equal to or greater than unity when said zipper is closed.

#### REMARKS

In ¶ 1 of the Office Action, the specification has been objected to as being incomplete "since pages 8 and 11 are blank except for the docket number and the page number". In response to the foregoing objection, the Applicant is submitting herewith a substitute specification with the blank pages removed. The specification as originally filed had 11 pages. On April 18, 2002, a substitute specification was submitted in response to a Notice to File Corrected Application Papers, which noted that the specification had improper margins. When the substitute specification was printed out, two
